

ID Card - Sodium rhenate
Version 26 May 2014

Notes:

- This ID card is used to support the substance sameness discussions in SIEFs and to describe the substance to the best of the SIEF members' knowledge.
- It also aims at grouping communications relevant to the request of available data or information, the approval of the proposed Lead Registrant and the registration strategy with the SIEF.
- It is the responsibility of each individual registrant to identify their substance and to report company-specific identity in their Registration Dossier (section 1 of IUCLID).

DISCLAIMER

All data and information contained in this document shall be treated by the receiving party (i) in full confidence with the adequate respect of any confidential and/or proprietary nature of such information and (ii) only in the framework of the purpose of agreeing on substance sameness, Lead Registrant and overall REACH Strategy for the concerned Substance under REACH (the 'Purpose'). The receiving party (and any representative) shall not be allowed to use or circulate any or all parts of this document for any other purpose than the Purpose, without the prior written consent of the Precious Metals and Rhenium Consortium (PMC). The content provided in this document is given for the Purpose and as such, no guarantee or warranty whatsoever (expressed or implied) is given as to its accuracy, completeness, merchantability or fitness for any particular purpose which the receiving party may have. In any case, any use by the receiving party would be made at its sole risk and liability.

1. Identification of the substance

Table 1. Identification of the substance

	Original (in EC inventory)
Name	Sodium rhenate
EC number	236-742-9
CAS number	13472-33-8
Description	Not available
Composition type	Mono-constituent substance

2. Synonyms and other identifiers of the substance

Table 2. Synonyms and other identifiers of the substance

IUPAC name	Sodium oxido(trioxo)rhenium
CAS name	Rhenate (ReO4 ⁻), sodium (1:1), (T-4)-
Abbreviations	None
Other commercial, brand or international names	Soda perrhenate Sodium perrhenate Perrhenic acid sodium salt

3. Substances (with core identifiers) also falling under this substance (with justification)

None

4. Information related to molecular and structural formula of the substance

Table 3. Information related to molecular and structural formula of the substance

Molecular formula	NaO4Re
Structural formula	 $\begin{array}{c} \text{O} \\ \parallel \\ \text{O}=\text{Re}-\text{O}^- \\ \parallel \\ \text{O} \end{array}$ Na ⁺

Smiles notation	[Na+].[O-][Re](=O)(=O)=O
Optical activity	None
Typical ratio of (stereo) isomers	Not applicable
Molecular Weight / Molecular Weight range	273,19 g/mol

5. Typical composition of the substance

Table 4. Typical composition

	Name	Symbol / Formula	Typical concentration (%)	Concentration range (%)
Main constituent(s)*	Sodium rhenate	NaO4Re	≥ 80	80 - 100 [§]
Other impurities##	Other	B, Hf, Nb, Ta, V, Co, Cr, Mg	≤ 20	0 - 20

* ≥ 80 % (w/w) for mono-constituent substances; ≥ 10 % (w/w) and < 80 % (w/w) for multi-constituent substances.

≥ 1 %. An impurity is an unintended constituent present in a substance, as produced. It may originate from the starting materials or be the result of secondary or incomplete reactions during the production process. While impurities are present in the final substance, they were not intentionally added.

< 1 % and potentially influencing the classification of the substance.

[§] Corresponds to 54,5-68,2 % Re, 18,7-23,4 % O, 6,7-8,4 % Na.

The composition given above is typical and should therefore represent the majority of Sodium rhenate as manufactured and/or imported in the EEA market. Sodium rhenate containing less than 54,5 % Re may still be considered to be the same for the purpose of registration under REACH and may be referred to as impure Sodium rhenate to distinguish it from the typically pure Sodium rhenate.

Sodium rhenate is manufactured and/or imported under strictly controlled conditions in the EEA market in a mixture containing sodium carbonate and sodium molybdate in an aqueous solution.

6. Information on appearance, physical state and properties of the substance

Table 5. Appearance / physical state / properties of the solid substance

Physical state	Solid
Physical form*	Crystalline (hexagonal plates)
Appearance	White powder
Particle size**	Powder (size unknown)
Does the substance contain 'bound water'?#	No
Does the substance contain 'crystallisation water'?#	No
Does the solid hydrolyse?##	No
Is the solid hygroscopic? [§]	Yes

* Crystalline form: solid material whose constituent atoms, molecules, or ions are arranged in an ordered pattern extending in all three spatial dimensions. Amorphous form: solid material whose constituent atoms, molecules, or ions are randomly arranged.

** Nanoform: particles in the size range 1 - 100 nm (for full definition of a nanomaterial, see <http://ec.europa.eu/environment/chemicals/nanotech/index.htm#definition>). Fine powder: particles in the size range 100 - 2.500 nm. Coarse powder: particles in the size range 2.500 nm - 1 mm. Massive object: particles in the size range > 1 mm.

'Bound water': water molecules that are coordinated as bound ligands. 'Crystallisation water' or hydration water: water that occurs in crystals (necessary for the maintenance of crystalline properties) but which is not directly bound to the metal ion (a hydrate contains a definite % of crystallisation water e.g. CuSO₄ × 5 H₂O, an anhydride does not contain any water)

Hydrolysis: decomposition (cleavage of chemical bonds) by the addition of water.

[§] Hygroscopic substance: readily attracts moisture from its surroundings in open air, through either absorption or adsorption. Cf. also water/moisture content in Table 4.

7. Analytical data

Annex VI of REACH requires the registrant to describe the analytical methods and/or to provide the bibliographical references for the methods used for identification of the substance and, where appropriate, for the identification of impurities and additives. This information should be sufficient to allow the methods to be reproduced.

Table 6. Analytical methods for identification of the substance

Parameter / Method	Recommended for substance identification and sameness check	Applicable	Not applicable or not recommended
Elemental analysis			
ICP (ICP-MS or ICP-OES)	X		
Atomic absorption spectroscopy (AAS)		X	
Glow discharge mass spectrometry (GDMS)	X		
Molecular analysis			
Infrared (IR) spectroscopy	X		
Raman spectroscopy			X
Mineralogical analysis			
X-Ray Fluorescence (XRF)			X
X-Ray Diffraction (XRD)	X		
Morphology and particle sizing			
Electron microscopy (SEM, TEM, REM)* #		X	
Laser diffraction* #		X	
Particle size by other means (e.g. sieve analysis)#		X	
Surface area by N-BET* #		X	
Other			

* Analytical techniques particularly (but not exclusively) relevant for nanomaterials.

The choice of the technique for particle size depends on the size of the material as manufactured/imported/placed on the market/used.

8. Lead Registrant

Climax Molybdenum (The Netherlands) volunteers to be the Lead Registrant for Sodium rhenate. The PMC will provide support to the Lead Registrant as laid down in the PMC Agreement.

9. REACH Strategy

The table below presents the overall Registration Strategy for Sodium rhenate based on the information available to the PMC by the date given above on the document.

The Registration Dossier will be prepared for the highest substance status (information requirements associated to a substance or Article 10 Registration being higher than an intermediate handled under strictly controlled conditions or Article 17 or 18 one) and associated tonnage band.

The recap below therefore reflects the scope of work of the PMC for Sodium rhenate and sets the minimum and maximum set of information that will be gathered and/or produced when preparing the Registration Dossier for Sodium rhenate as described in this ID Card.

If higher information requirements are necessary, these can be included in the Registration dossier prior to its first submission to ECHA (if PMC is made aware of these additional requirements in-time) or as an update to the already submitted dossier.

Table 7. REACH strategy for the substance (basis for REACH Registration preparation)

Item	Description
REACH category	Mono-constituent
Highest status	SCC Intermediate*
Highest tonnage band	1-10
Information requirements	Available / Existing + Annex VII
Existing classification**	None
Registration deadline	2018

*Sodium rhenate is manufactured and/or imported under strictly controlled conditions in the EEA market in a mixture containing sodium carbonate and sodium molybdate in an aqueous solution

**For the pure form, as per latest CLP notification exercise (December 2010 & March 2012)

10. Scope of the Registration Dossier

The uses included in this Registration Dossier are summarised in the table below and accompanied with the appropriate text.

Table 8. Reported uses of the substance

Description of use	Sector of Use (SU)	Process Category (PROC)	Environmental Release Category (ERC)
Use as an intermediate under SCC	<ul style="list-style-type: none">• 3: Industrial uses: Uses of substances as such or in preparations at industrial sites• 9: Manufacture of fine chemicals• 14: Manufacture of basic metals, including alloys	<ul style="list-style-type: none">• 1: Use in closed process, no likelihood of exposure• 3: Use in closed batch process (synthesis or formulation)	<ul style="list-style-type: none">• 6a: Industrial use resulting in manufacture of another substance (use of intermediates)
